

# AGH UNIVERSITY OF SCIENCE AND TECHNOLOGY

# Seminar in *Artificial Intelligence* Word embedding

Marcin Trebunia, Dominik Rygiel, Konrad Adamczyk

**Department of Telecommunications** 

27.05.2019

### Agenda

- Introduction
  - Why do we need word embedding
  - Types of encoding
  - General concept
- Word embedding models
  - Training approaches
  - Word2Vec
  - GloVe
  - FastText
- Applications
  - Natural Language Processing
  - Other domains
- Problems and limitations

Summary Word embedding

### Introduction

What is word embedding?

Seminar Word embedding 3/43

### Introduction

Word embeddings are one of the few currently successful applications of unsupervised learning. Their main benefit arguably is that they do not require expensive annotation, but can be derived from large unannotated corpora that are readily available. Pre-trained embeddings can then be used in downstream tasks that use small amounts of labeled data

NLP Research Scientist, Sebastian Ruder

Seminar Word embedding 4/43

### Introduction

What a **lovely** day. What a **nice** day.

Seminar Word embedding

### **Encoding text**

# Why do we need to encode text?

Machine learning models take vectors (arrays of numbers) as input.

Seminar Word embedding 6/43

### One hot encoding

Seminar Word embedding 7/43

# One hot encoding (cont.)

- Words are completely independent of each other
- Inefficient approach: vector is sparse

Word embedding 8/43 Seminar

# One hot encoding (cont.)

### Example:

- Dictionary of 10,000 words
- One hot encode each word
- Each vector's elements are 99.99% zeros!

9/43 Seminar Word embedding

### Unique number encoding

What 
$$= [1]$$
 $a = [2]$ 
lovely  $= [3]$ 
nice  $= [4]$ 
day  $= [5]$ 

# Unique number encoding (cont.)

- + Efficient dense vector
- Encoding arbitrary does not catch relationships between words
- Can be challenging for a model to interpret

Seminar Word embedding 11/43

What = 
$$\begin{bmatrix} 1.2 & -0.1 & 4.3 & 3.2 \end{bmatrix}$$
  
a =  $\begin{bmatrix} 0.4 & 2.5 & -0.9 & 0.5 \end{bmatrix}$   
lovely =  $\begin{bmatrix} 2.1 & 0.3 & 0.1 & 0.4 \end{bmatrix}$   
nice =  $\begin{bmatrix} 2.0 & 0.4 & 0.3 & 0.5 \end{bmatrix}$   
day =  $\begin{bmatrix} 3.0 & -0.6 & 3.5 & -0.8 \end{bmatrix}$ 

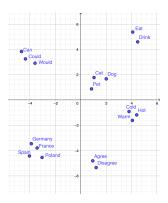

Seminar Word embedding 12/43

- Words with similar context occupy close spatial positions
- The cosine of the angle between words' vectors should be close to 1 (angle close to 0)

Seminar Word embedding 13/43

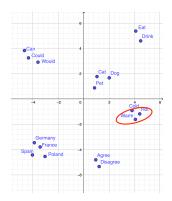

Example result of word embedding

Seminar Word embedding 14/43

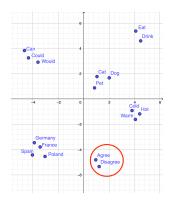

Words are synonyms

Seminar Word embedding 15/43

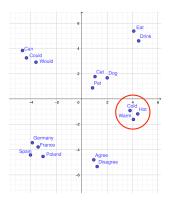

Words are antonyms

Seminar Word embedding 16/43

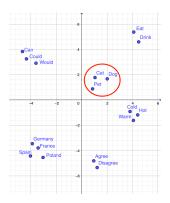

Words are value on a scale

Seminar Word embedding 17/43

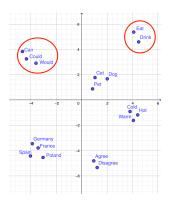

Words are hyponym - hypernym

Seminar Word embedding 18/43

Words appear in similar context

Seminar Word embedding 19/43

### Word embedding models

- Training approaches
- Word2Vec
- GloVe
- FastText

Seminar Word embedding 20/43

# How to train my embedding model?

- CBOW
- Skip-gram

Seminar Word embedding 21/43

### **CBOW**

### Words representation

- Continuous Bag-of-Words
- Prediction of current words based on context
- Context is determined by surrounding words

Seminar Word embedding 22/43

### **CBOW**

### Words representation

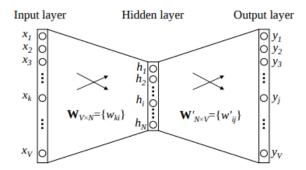

Figure: Simple CBOW model with one word in the context

Seminar Word embedding 23/43

### **CBOW**

### Words representation

$$p(w_j|w_I) = \frac{\exp(v'_{w_j}^T v_{w_I})}{\sum_{j'=1}^V \exp(v'_{w_{j'}}^T v_{w_I})}$$

Seminar Word embedding 24/43

# Skip-gram Words representation

- Continuous Skip-gram
- Predicting the surrounding words based on the context

Context is the current word

Seminar Word embedding 25/43

# **CBOW vs Skip-gram**

#### Words representation

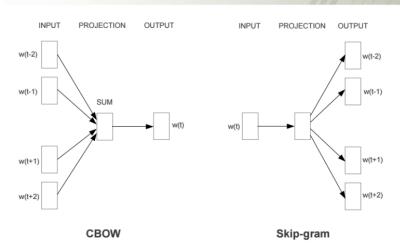

Figure: CBOW vs Skip-gram

### Word2Vec

#### Word embedding models

- Created by researchers at Google in 2013
- Can use either CBOW or skip-gram
- Input is a corpus of text
- Produces vector space with unique word

27/43 Seminar Word embedding

# Word2Vec

#### Interesting parameters

- Dimensionality!
- Training algorithm softmax vs negative sampling
- Context window

Seminar Word embedding 28/43

### GloVe

#### Word embedding models

- Global Vectors for Word Representation
- Comes from Stanford University, open-source
- Kind of extension of Word2Vec
- Training performed on aggregated, global word-word co-occurence statistics

29/43 Seminar Word embedding

# GloVe

#### Word embedding models

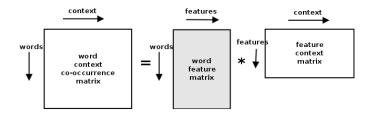

Figure: Co-occurence statistics of words

Seminar Word embedding 30/43

### **FastText**

### Word embedding models

- Incorporate sub-word information!
- Naturally support out-of-vocabulary words
- Uses skip-gram with negative sampling

Seminar Word embedding 31/43

# FastText Word embedding models

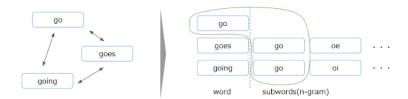

Figure: FastText subwords example

Seminar Word embedding 32/43

# How can we use it?

Seminar Word embedding 33/43

### **Natural Language Processing**

- If user search for "Dell notebook battery size" we would like to match it also with "Dell laptop battery capacity"
- If user search for "Cracow Motel" we would like to match it. also with "Krakow Hotel"

Seminar Word embedding 34/43

# **Natural Language Processing**

- Analyzing survey responses
- Analyzing comments

Seminar Word embedding 35/43

### Other domains

- Word2Vec can catch relationships and contexts in songs the user listens to
- Data can be used for real-time music recommendation

Seminar Word embedding 36/43

### **Problems and limitations**

- Multiple meanings of a word: solution Sense embeddings
- Inability to handle unknown or out-of-vocabulary (OOV) words
- Scaling to new languages
- No shared representations at sub-word levels

37/43 Seminar Word embedding

# Summary

Seminar Word embedding 38/43

# **Summary**

• ..

• ...

Seminar Word embedding 39/43

# Thank you for your attention!

Seminar Word embedding 40/43

# Q & A

Seminar Word embedding 41/43
